

Exercises - Session 24

In case you get stuck anywhere, don't be afraid to ask the coaches! They are here to help and will gladly explain everything to you! Take notes during the exercises. Even if you never look at them again, they will help you memorise things!

Layout and HTML5 elements

In this exercise you will improve on your party sign up-form from Session 23. So everyone has the same starting position, please get the source code you can build upon from:

<https://github.com/rubymonstas-zurich/party-guests/tree/session-24>

1. Currently the app is a single page. To add new sites we need some form of navigation for the user. Add a header, a sidebar and a footer. Wrap the main content in an element too! You want to use the new HTML5 elements introduced (`nav`, `header`, `section`, `footer`). Add placeholders into the header and navigation.

After this step the site will look really silly. Do not fret: We will remedy that in the next step

2. Add the necessary CSS to mimic the layout to the right. Make it work on your screen, do not worry about resizing. Add this CSS to `styles.css`

3. Add 3 Links to the sidebar. Use `..`. It does not matter where they point to.

4. Add a video player to the content. Make it autoplay.

Header	
Sidebar (nav)	Content (section)
Footer	

More Layouting

1. We want to move the sidebar from the left to the right. How can you achieve this?

Optional Part

1. We want to move the navigation into the header and get rid of the sidebar altogether. How can you achieve this? You may also need to re-layout the navigation itself (``). This is tricky, don't be afraid to ask!
